

NOISE CONTROL BOYS AND GIRLS CLUB

We were contacted by the Boys and girls club to help to reduce ECHO Reverberation in their Gym, our engineers suggested using our Acoustical WALL PANELS and CEILING BAFFLES after these products were installed the 20 DB LEVELS was reduced in the gym which was a pleasure for the players, audience, and teachers as if they even hold any events in the Gymnasium it is the very comfortable listening environment now.

The acoustical wall panel is an important part of any soundproofing project. They are used to absorb sound waves and reduce noise levels in a room. Acoustic panels are available in a variety of sizes and thicknesses and can be made from different materials such as fiberglass, foam, or fabric.

The type of panel you choose will depend on the specific noise-reduction needs of your space. Acoustic panels can be mounted on walls or ceilings, and some types can even be hung from the ceiling like a tapestry. In addition to reducing noise levels, acoustic panels can also improve the clarity of sound in a room by reducing echoes.
