

### Offsite Construction Guide

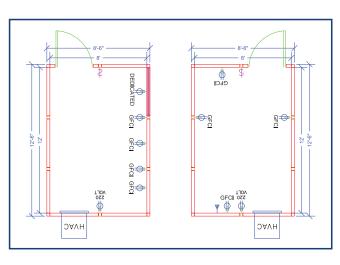

#### A clear layout and understanding of the structure's intended use are essential.

- A layout and a general understanding of the structure's intended use are essential.
- If a layout has not been determined, an All Noise Control representative can conduct a site visit to assess the project environment and collaborate with you on the layout.
- The structure's purpose will help define load ratings and may require design adjustments.
- Our engineering team will provide a CAD drawing of the structure.
- If necessary, modifications can still be made, leading to an updated drawing.
- A formal sales quote will be provided alongside the drawing, outlining the project scope, materials, pricing, and additional options.
- Once the structure's design is finalized, the end user, along with any relevant third-party regulators, must approve it.
- Upon receiving a signed Purchase Order, All Noise Control will transition the project into the engineering phase.

## **Engineering**

- Each project undergoes a thorough review by All Noise Control's engineering department.
- The team ensures that all aspects of the proposal are accurately reflected in the drawings.
- A customer package is provided, outlining the full scope of the project.
- This package includes floor plans, warranty details, installation instructions, and notifications regarding load-bearing or non-load-bearing elements (if applicable).
- If required, project drawings can be stamped by a third-party engineer.

# **Manufacturing**

- Once all project designs have been approved and finalized, the manufacturing phase begins.
- Our structures are fabricated at one of our four manufacturing facilities, depending on the structure type.
- After fabrication, the structure's components are either pre-assembled at our facility or packaged for shipment to the job site.

## **Shipping**

- All Noise Control ships to all regions across the United States and has completed projects internationally.
- Customers have the option to arrange their own freight if preferred.
- Structures can also be picked up directly from our manufacturing facility.
- All Noise Control's shipping department carefully loads the materials onto a semi-trailer truck for delivery to the job site.

## **Site Preparation & Installation**

- During the manufacturing phase, we recommend preparing the job site for the structure's installation.
- Once delivered, a specialized installation crew will assemble and install the structure.
