

What Is the B10LAG Wrap Barrier?

The **ANC-B10LAG** is a high-performance acoustic lagging wrap that integrates a dense vinyl noise barrier. This product is made from specialized materials designed to block and isolate sound transmission effectively. Its unique construction and loaded vinyl layer make it an excellent choice for reducing noise across a wide range of frequencies.

- **How It Works:** The **B10LAG** works by increasing the mass of the system it is applied to, making it more difficult for sound waves to pass through. This is known as mass-loaded vinyl, a common approach in soundproofing that effectively blocks both high- and low-frequency noise. The vinyl layer is reinforced with a durable aluminum-facing Mylar layer, ensuring long-lasting performance and ease of installation.

The **B10LAG** provides both noise isolation and durability, making it suitable for a wide variety of industrial, commercial, and residential applications.
