

Ideal Applications for B10LAG1

What Is Acoustic Lagging and Why Is It Important?

The **ANC-B10LAG1** is designed for versatility, suitable for use in many environments where noise and temperature control are necessary.

- **HVAC Systems:** In both commercial and residential settings, HVAC systems are a primary source of noise. Ductwork and piping can carry high levels of sound. By wrapping ducts with **B10LAG1**, the sound from air traveling through these ducts is significantly reduced, improving acoustic comfort in the building.
- **Industrial Piping:** Pipes carrying liquids or gases, particularly in industrial or manufacturing facilities, can produce vibrations that lead to unwanted noise. B10LAG1 helps reduce these vibrations and noise levels.
- **Mechanical Equipment:** Larger mechanical equipment, including compressors, pumps, and machinery, produces sound and vibration. B10LAG1 can be used around equipment to dampen this noise, improving both the working environment and overall system efficiency.
