GE Enterprises required reliable acoustic separation between high-noise testing areas and nearby assembly zones, where ongoing equipment activity was creating disruptive background noise. This noise made communication more difficult and affected overall workflow efficiency. Traditional fixed walls were not a practical option, as they limited flexibility and made it harder to adjust layouts as testing and production needs evolved.

To address these challenges, All Noise Control implemented the ANC-17 Acoustic Curtain system, using decorative soundproof curtains to define quieter work zones. The system incorporated sound dampening curtains designed to control sound transmission between adjacent areas while maintaining clear access, visibility, and ease of movement for employees.

With the ANC-17 system in place, GE Enterprises experienced improved acoustic separation, clearer communication, and a more comfortable working environment. The flexible design of the acoustic curtain system also allows the facility to adapt quickly to changing testing and assembly operations without the need for permanent construction.
