“In our research and development facilities, clarity of communication is critical. Prior to working with All Noise Control, many of our meeting rooms and collaboration areas were affected by reverberation caused by reflective surfaces and high ceilings. This made presentations, discussions, and hybrid meetings more difficult than they should have been.

All Noise Control provided an acoustic ceiling cloud system that delivered effective sound damping and reverberation control while meeting our strict commercial and safety standards. The ceiling-mounted panels were installed without disrupting ongoing operations and immediately improved the acoustic quality of the spaces.

After installation, speech intelligibility improved significantly, background noise was reduced, and meetings became easier to follow—even during complex technical discussions. The solution allowed us to maintain the clean, functional aesthetic required in a laboratory environment while delivering measurable improvements in acoustic comfort and productivity.”
