Bridgestone's tire manufacturing plants rely on complex HVAC systems, high-pressure process piping, and mechanical equipment to maintain production efficiency. These systems can transmit vibration, low-frequency rumble, and airborne noise throughout the plant, affecting worker focus, comfort, and safety.

The ANC-B10LAG Wrap Barrier from All Noise Control offers a high-performance solution. Its mass-loaded vinyl construction provides dense acoustic blocking, while the reinforced aluminum-faced mylar layer ensures chemical, moisture, and heat resistance. Installed over HVAC ducts, process piping, and pumps, the B10LAG delivers soundproof duct wrap, acoustic pipe and duct wrap, pipe wrap, air duct wrap, and HVAC duct insulation wrap performance in one versatile system.

Beyond acoustic control, the B10LAG improves thermal insulation, prevents condensation on chilled water lines, and enhances energy efficiency. With quick installation using matching tape over existing insulation, Bridgestone can maintain noise reduction and thermal protection without disrupting production or requiring complex retrofits. This solution provides durable, reliable pipe soundproofing wrap for demanding industrial environments.
