"In our chemical processing facility, the combination of high-pressure piping, HVAC ductwork, and mechanical systems made it tough to keep noise and heat under control. The constant vibration and airborne noise from equipment, along with condensation on chilled lines, were creating challenges for worker comfort and energy efficiency.

The ANC-B10LAG Wrap Barrier from All Noise Control solved the problem. Its mass-loaded vinyl and reinforced aluminum-faced mylar blocked the noise and absorbed vibration, while also providing thermal insulation and preventing condensation. Best of all, it installed quickly over our existing insulation, making a real difference for our team and our operations."
