"At Caterpillar, maintaining safe and efficient production environments is central to our operational standards. Noise from engine testing equipment and mechanical systems was affecting communication within certain areas of our facility, and we needed a solution that would significantly reduce sound levels without interrupting workflow or restricting equipment access.

All Noise Control designed and installed a customized Soundproof Metal System that delivered measurable noise reduction while maintaining ventilation and full maintenance accessibility. Since implementation, we've experienced noticeable improvements in communication and overall working conditions. The enclosure system is structurally robust, professionally finished, and well-suited for our demanding manufacturing environment."
